Tests for category membership in Klallam and Northern Straits can be found in the distribution of the constituents of what have been called complex predicates, the first element of which typically has no overt morphology. Among these first elements we can identify a category of auxiliary and three categories of nonpredicative, adverbial intensifier. Verbs, as opposed to nominal and adjectival lexical items, can be identified as the class of lexical items that may follow auxiliaries. Among the remaining lexical items, nouns can be distinguished from adjectives and adjectives from auxiliaries by syntactic position and, in certain constructions, number agreement.

[KEYWORDS: Straits, Klallam, Saanich, Salish, auxiliary, noun, verb, adjective, adverb, category, constructions, complex predicates]

1. Introduction. Thompson and Thompson (1971), in their sketch of Klallam, found it useful to consider just two kinds of words: full predicates and particles. They find no other categories necessary. Jelinek and Demers (1994), with examples from Northern Straits, demonstrate much of the ample evidence for the absence of categories in support of the pronominal argument hypothesis.

These two languages, Klallam and Northern Straits, are very closely related languages of the Straits subgroup of Central Salishan. This paper describes classes of words in the Straits languages that have been traditionally called “auxiliaries” and shows that their distribution provides evidence that there are distinct categories of verb, noun, and adjective in these languages and that there are straightforward tests for identifying them. The data come from Klallam, but the facts are essentially the same in Northern Straits.

1.1. The categories problem in Salishan languages. The problem of finding evidence for grammatical categories in Salishan languages is well known and frequently mentioned in Salishan and typological literature. Kuipers (1968), Jacobsen (1979), and Kinkade (1983) are most frequently

---

1 All data presented here are from fieldwork that has been supported by grants from the National Science Foundation, National Endowment for the Humanities, the Whatcom Museum Jacobs Fund, and the University of North Texas. I thank Ivy Doak, the IJAL anonymous referees, and participants of the Thirty-sixth International Conference on Salish and Neighbouring Languages (2001) and the 2002 SSILA meeting for comments on earlier versions of this paper.

2 See Montler (1999) for details on how these two languages are alike and different.
cited. Kuipers and Kinkade present the case against a noun/verb distinction. Jacobsen summarizes the long history of discussion of categories in the languages of the Northwest North American linguistic area and is the first to argue explicitly for a distinction between nouns and verbs in Nootkan and Salishan.

Among Salishanists who have argued for the existence of grammatical categories in several of the languages are: Van Eijk and Hess (1986), who find semantic categories noun and verb in Lillooet and Lushootseed, but without, as they say, syntactic significance; Mattina and Mattina (1995), who find a morphological test for Okanagan in a pair of prefixes that are similar in sound and meaning, where one occurs on nouns and the other on verbs; and Matthewson and Demirdache (1995) and Davis, Lai, and Matthewson (1997), who find syntactic evidence of nouns for St'at'mcets (Lillooett).3

A linguist not working on or new to Salishan languages might wonder, given Jacobsen (1979) and the other arguments for categories in Salishan languages, why some Salishanists maintain category neutrality. The problem is nicely understated by Matthewson and Demirdache: "the evidence for the distinctions between NP, AP, and VP... is very subtle. In contrast, the evidence for category neutrality... is overt" (1995:75).

1.2. The s- prefix as a category test. Before beginning the particular topic of this paper—the description of the auxiliaries in the Straits languages and how their distribution provides evidence for category distinctions—I think it will be useful to give a sample of some of the facts that allow some Salishanists to maintain category neutrality. The following short discussion of the s- prefix illustrates the difficulties in finding a simple and robust test for categories in Salishan languages.

Jacobsen (1979) presents evidence for categories that is applicable to Salishan in general. Although he principally discusses the neighboring Nootkan languages, where category distinctions are also difficult, he briefly

3The argument for categories in Northern Straits presented in Haag (1998) is vitiated by a lack of familiarity with the language. There, the author presumed that CsC- reduplication regularly indicates plural in the Straits languages and then looked at that pattern of reduplication in two Northern Straits words: nathlon 'dive' and steléni? 'woman'. Since the glosses for the reduplicated form of the former word are aspectual and the latter plural, this is taken as evidence that the two belong to different categories.

Actually, both nathlon and steléni? can have the 'collective plural' or the 'repetitive' aspectual interpretations. Haag states: "if all lexical items are undifferentiated predicates... we should get both 'dive repeatedly' and 'be a woman over and over'.' In fact, we do. While nathlon means 'they dive' or 'dive again and again' or 'be one dive after another', steléni? can mean 'they are a bunch of women' (in its collective plural interpretation) or 'be one woman after another'.
discusses (1979:96–104) the pan-Salishan /s-/ prefix as a nominalizer and as evidence for a category noun.

Some words like the word for ‘eat’ require the prefix before the possessive morphology can be attached. Other words do not allow the s- prefix. Examples (1) and (2) are from Klallam. In these and the following examples, the s- prefix in question is in boldface.

(1) ?iln ‘eat’
    tän ‘mother’
(2) ns?iln ‘my food’ (*n?iln)
    ntán ‘my mother’ (*nstán)

In (1), the words for ‘eat’ and ‘mother’ do not have the s-. In (2), the word for ‘eat’ must take the s- before the first-person possessive can be applied, while the word for ‘mother’ may not take the s-. Therefore, according to the proposed test, we can identify the class of words that must have the s- as verbs and the class that does not take the s- prefix with the possessive as nouns.

This classification works for many words, but the problem is that many words with the s- are not derived nouns. In Northern Straits, for example, the words swóy’qə? ‘man’ and sténiʔ ‘woman’ both occur with the s-, so they would seem to be derived nouns; but the words for ‘baby boy’ and ‘baby girl’ are the same as ‘man’ and ‘woman’ but without the s-: wóy’qə? and tənʔiʔ. In Klallam, there are a pair of words with and without s- with a similar relationship: xaykwuyeʔé ‘mountain’ and sxaykwuyeʔé ‘range of mountains’. The word sqéxaʔ ‘dog’ has the s- but pís ‘cat’ does not; swíw’las ‘young man’ does, while q’éʔniʔ ‘young woman’ does not; and so on for many more examples.

Almost all words take the same morphology if semantically allowable, whether the s- is present or not. (3) shows the regular form of the imperfective—a glottal stop infix.

(3) ?iln_yaʔ?_cn.
    eat_PAST_SUBJ
    ‘I ate’.
    ?ē?ln_yaʔ?_cn.
    ‘I was eating’.

The examples in (4a) and (4b) show forms with the s- prefix.

(4a) sqíʔám’ ca ns?iln.
    no good DET
    ‘My food is no good’.
(4b) sqiʔám' cə nsʔéʔln.

‘What I’m eating is no good’.

In (4a), the subject seems to be a noun, but in (4b), with the imperfective aspect, it seems to be a headless relative clause. The s- might more economically be considered a marker of subordination rather than a nominalizer.

Example (5) shows that words with the s- prefix can be main predicates with un-nounlike meaning.

(5) sʔln_yaʔ_čn (ʔaʔ kʷsə pəpχʷʔyqsn).

‘I was eaten up (by mosquitoes)’.

Consultants in both Klallam and Northern Straits insist that sentences such as (5) cannot be translated ‘I was food’.

Almost any word, with s- and without, even proper names, even when following a determiner in an NP, can be marked for aspect and tense. Almost any word can be marked for the collective plural, diminutive, imperfective, transitive, and so on. There are cardinal numbers and even person deictic predicates, translated as first- and second-person pronouns, that may take this morphology. It not being the central purpose of this paper to recapitulate all of this evidence here, I refer the reader to Kinkade (1983), Jelinek (1990), Jelinek and Demers (1994), and especially Kuipers (1968) for more examples.

No one, as far as I know, denies that there are indeed semantic categories ‘nominal’—referring to ‘people, places, or things’—and ‘verbal’—referring to ‘actions or states’—words in Salishan languages. The problem lies in finding operational tests for morphosyntactic categories noun and verb corresponding to these semantics. Many interesting things can be said about the complex phonology and morphology of these languages without reference to categories of words. On the other hand, much of what can be said about grammatical relations and syntax in general in Salishan languages can be said simply assuming that there are nouns and verbs. We expect to find categories since languages generally distinguish categories, but the burden of proof is on those who would multiply categories.

As it turns out, words with the s- prefix in the Straits Salishan languages are indeed not verbs: they reliably fail the test for Verb-hood described in 5 below. Furthermore, words with the s- prefix pass the test for Noun-hood described in 7.

In addition to the categories noun and verb, this paper provides evidence for several distinct categories of Auxiliary (5.1) and several categories of Adverbial Intensifier (5.2–5.5). Section 6 gives further evidence for a category distinction between true auxiliaries and the intensifiers when they occur in transitive clauses. In addition to the test for the category Noun, 7
provides evidence for the existence of a category of Adjectives in the Straits languages.

Before I present the evidence for these categories, it is necessary to present some basic, background description of aspects of Straits Salishan grammar. Section 2 introduces the Auxiliaries, the class of words around which the arguments in this paper revolve; 3 describes the simple predicates; 4 describes what have been called complex predicates and second position clitics; 8 presents one more unrelated bit of evidence for categories; and 9 provides a summary and conclusion.

2. Auxiliaries. Thompson and Thompson (1971:263) briefly mention a class of lexical items in Klallam they call "auxiliaries," which appear in complex predicate constructions. They give four examples with this comment: "One kind of independent particle affects predicates in an important way: auxiliaries appear first in their predicates, followed by a full word as predicate center. Such predicates are complex. In such cases predicate pro-clitics remain bound to the predicate center, but enclitics follow rather the auxiliary."

The four examples that Thompson and Thompson give have been reelicited from native speakers and are repeated here in (6) with transcription adjusted to the current understanding of Klallam morphophonemics. The auxiliary and its gloss are in boldface.

(6a) mán’_cn ?u?_qákʷt.
very_1SUBJ ?u?_tired
'I'm awfully tired'.

(6b) tuʔ_xʷ_yaʔ ?u?_wəsəʔys.
exactly_PAST ?u?_bark
'It [the dog] was just beginning to bark'.

(6c) čw’ín’_cn ?uʔ_qiʔnúʔət.
even_1SUBJ ?uʔ_angry
'Even I was angry'.

(6d) k’áy_u_cxʷ ?uʔ_éʔtn’
also_QUEST_2SUBJ ?uʔ_eating
'Are you eating, too?'

Only relevant morphology is indicated. An underline attaches clitics to their hosts.

For a description of Klallam subject and object markers, see Montler (1996).
Thompson (1979a) looks at the auxiliaries from a historical perspective to try to find an explanation for the varying position of subject enclitics across the Salishan languages. Of particular interest here are the Klallam examples given. One reelicited example is repeated here:

\[(7) \quad \text{hiyá}_\text{PAST}_\text{SUBJ} \quad \text{t'ák}_\text{SUBJ} \]
\[\text{go} \quad \text{cross}\]
\[\text{`I went across'}.\]

The auxiliary in (7) seems quite different from those in (6) in at least two respects. First, they differ semantically. In (6), it is the auxiliary that adverbially modifies the main predicate. In (7), however, it appears that it is the main predicate \(t'ák\) that provides manner adverbial modification to the auxiliary, \(hiyá\). The second way they differ is syntactically. The proclitic \(\text{go}\) is required in the sentences in (6) but not in the one in (7). The differences between (6) and (7) suggest that we have two different constructions and two different lexical categories.

Poggi (1981) looks at some of the items in this class of words and analyzes the constructions as complex sentences with the auxiliary as the main predicate and the second predicate as subordinate. Jelinek (1990) discusses the Lummi cognates of these constructions in more detail.\(^7\) Jelinek assumes, as does Poggi, that the auxiliaries are predicates but that those in (6) are adverbial "second order predicates," not main predicates followed by subordinate clauses.

This paper explores these possibilities, describing and exemplifying these constructions in detail. I show how the two constructions in (6) and (7) are fundamentally different and how they provide evidence for the grammatical categories verb and adverbial intensifier as distinct from each other and as distinct from other contentive categories. I also show that aside from the two constructions in (6) and (7), there are at least two other similar constructions.

3. Simple predicates. Simple predicates in Klallam are basically the same as those in most other Central Salishan languages: the predicate comes first, immediately followed by zero or more speech-act enclitics.\(^8\) All

---

\(^6\) This \(\text{go}\) undoubtedly has the underlying form \(w'\), and it is probably a prefix rather than a clitic. These points are not relevant to this paper, therefore I present the morpheme here as traditionally done to allow for easier comparison across languages and dialects.

\(^7\) The details of constructions under discussion in Klallam are essentially the same in the closely related Northern Straits dialects Saanich and Lummi. The major differences are phonological with an occasional noncognate lexical item, such as Klallam \(\text{xa₇hn}'\) and Northern Straits \(\text{mək}'\) 'all'.

\(^8\) These enclitics situate the speech act and include first- and second-person subjects, past and future tense, and various evidentials and question markers. The Klallam version of these is very similar to what were called "post-predicate particles" in Saanich (Montler 1986).
but the first of the auxiliaries in (6) and (7) can also be simple predicates, as in (8).

(8a) hiyáʔ_yaʔ_cn.
gO_PAST_1SUBJ
‘I went’.

(8b) tūʔxʷ_yaʔ.
middle_PAST
‘It was the middle’.

(8c) čw’ín’_cn.
even_1SUBJ
‘Even I am’.

(8d) k’áy_u_cxW?.
also_QUEST_2SUBJ
‘Are you, too?’

The second predicates in (6) and (7) can also be simple predicates, as shown in (9).

(9a) qákʷi_l_cn.
tired_1SUBJ
‘I’m tired’.

(9b) wəsə̱s_yaʔ.
bark_PAST
‘It [the dog] barked’.

(9c) qíʔnúʔə̱t_cn.
angry_1SUBJ
‘I was angry’.

(9d) ?ə̱ʔn’_u_cxW?
eating_QUEST_1SUBJ
‘Are you eating?’

(9e) t’ákʷi_yaʔ_cn.
cross_PAST_1SUBJ
‘I crossed’.

9 Tense marking is not obligatory in Klallam. Sentences unmarked for tense may be translated with any tense depending on context.
Four types of constituents can immediately follow this simple predicate/enclitic bundle: a determiner phrase (example 10), a prepositional phrase (11), a subordinate clause (12), or a conjoined DP (13).

Up to two determiner phrases are possible:10

(10a) hiyáʔ_yaʔ ca_swóyʔqáʔ.

go_PAST DET_man

'The man went'.

10 These determiner phrases may be seen as arguments or as adjuncts indexed to pronominal arguments. If there is one, it is always coreferential with the intransitive subject and usually with the transitive object; but if the context is clear, it may be coreferential with a transitive subject. For example:

c̓aʔdzíʔ ca_sútl.
build-3SUBJ DET_road

'He built the road'.

But:

c̓aʔdzíʔ ca_nçáʔ.
build-3SUBJ DET_my father

'My father built it'.

In the former the determiner phrase is the object, while in the latter it is the subject.

If there are two DPs, a relatively rare but certainly natural occurrence, the first, if they are of equal animacy, is indexed to the subject and the second to the object. In both Klallam and Saanich, unlike what Jelinek and Demers (1994) report for Lummi, the order of subject and object DPs in such cases is fixed. Order between the two is free when one is clearly of higher animacy than the other:

ccat-s ca_nçáʔ ca_sútl.
build-3SUBJ DET_my father DET_road

'My father built the road'.

Or:

c̓aʔdzíʔ ca_sútl ca_nçáʔ.
build-3SUBJ DET_road DET_my father

'My father built the road'.

Also, the order is free when one is marked as the possessor of the other. In this case, the only interpretation allowed is where the possessor is subject and the one marked for possession is the object. For example:

kʷáʔnts ca_swéwʔas ca_cat-s
look at DET_boy DET_father-his

Or:

kʷáʔnts ca_cat-s ca_swéwʔas
look at DET_father-his DET_boy

Both are interpreted as 'The boy saw his father'. It seems that the interpretation that would produce the equivalent of 'His, father saw the boy' is blocked. Whatever the explanation for this pattern, it does indicate that there is syntax involved beyond that expected of mere adjuncts.
AUXILIARIES IN STRAITS SALISHAN

(10b) k’wants ca_sway’qa_? ca_sidni.
look at DET_MAN DET Woman
‘The man looked at the woman’.

A prepositional phrase is marked by the one general-purpose oblique case marker, ?a?:

(11a) hiyá?_cn ?a?_c_e _süt
go_1SUBJ PREP DET Door
‘I went to the door’.

(11b) k’wannəŋ cn ?a?_c_e_swáy’qa_?
be seen_1SUBJ PREP DET man
‘I was seen by the man’.

(11c) šč’át_u_cxw ?a?_c_e_šč’áya_?
hit QUEST 2SUBJ PREP DET Stick
‘Did you hit it with a stick?’

There are three types of non-DP subordinate clauses: ‘if/when’ clauses marked by the subjunctive clause indicating proclitic kwa? (12a), ‘while’ clauses marked by the proclitic əl (12b), and subjective genitive clauses (see Montler 1996 for examples of this latter type of clause).

(12a) hiyá?_cn kwa?_hiyá?-xw.
go_1SUBJ SUBORD go-2SUBORDSUBJ
‘I’ll go if/when you go’.

(12b) hiyá?_cn əl_hiyá?-xw.
go_1SUBJ WHILE go-2SUBORDSUBJ
‘I’ll go when/while you go’.

The conjoined DP is preceded by the comitative conjunction ʔi?:

(13) hiyá?_cn ʔi?_c_e_ncat.
go_1SUBJ COM DET my father
‘My father and I went’ or ‘I went with my father’.

These exhaust the types of constituents that can immediately follow a simple, sentence-initial predicate-enclitic.

4. Complex predicates and second-position clitics. The complex predicate constructions are assumed to be any that do not correspond to the patterns presented in 3 above. That is, we assume that we have a complex predicate construction whenever the sentence-initial full word-enclitic bundle is followed by something other than a determiner phrase, prepositional
phrase, subordinate clause, or conjoined determiner phrase. What all such constructions have in common is that they have two or more predicative words with one subject and neither is subordinate to the other. Such is the case in examples (6) and (7). In order to show that there are in fact complex predicates in Klallam, it is first necessary to describe the placement of the speech-act enclitics.

It has been established, at least since Demers (1980), that the speech-act enclitics in Straits Salishan languages are strictly second-position clitics. The enclitic bundle forms a constituent itself that attaches to the first major word of the sentence.\footnote{Demers (1980) refers to the enclitic bundle constituent as \textit{AUX}.} The sentences in (14) and in particular the complex predicate construction in (14c), a Klallam version of the Lummi example given by Demers (1980:13), show that the enclitic is the subject of the whole passive predicate complex and not just of the first predicate. (14c) is not merely a combination of (14a) and (14b), and the second predicate of (14c) is certainly not subordinate.

(14a) \textit{hiyáʔ-yəʔ-cxʷ}.  
\textit{gO\_PAST\_2SUBJ}  
‘You went’.

(14b) \textit{kʷnn-ʔəŋ-yəʔ-cxʷ}.  
\textit{see-PASSIVE\_PAST\_2SUBJ}  
‘You were seen’.

(14c) \textit{hiyáʔ-yəʔ-cxʷ kʷnn-ʔəŋ}.  
\textit{go\_2SUBJ see-PASSIVE}  
‘Someone went to see you’.

A characteristic typical of second position clitics is that they may be inserted to break up what one would expect to be an unbreakable constituent. Compare (15a) and (15b):

(15a) \textit{ʔun nʔ-či-táʔ-cs}.  
\textit{ten COM\_DET\_eight}  
‘eighteen’.

(15b) \textit{ʔun-yəʔ \textit{cn nʔ-či-táʔ-cs séeʔánʔəŋ}}.  
\textit{ten\_PAST\_1SUBJ COM\_DET\_eight year}  
‘I was eighteen years old’.

(15a) shows the normal method of forming numbers eleven through nineteen. ‘Eighteen’ is literally ‘ten and an eight’. When ‘eighteen’ is the pred-
icate, the subject and tense markers attach to the first word even though it breaks into the constituent ‘eighteen’.

It can thus be seen that at least constructions such as (7) and (14c) with hiyáʔ are indeed complex predicates. Each is composed of two major constituents that may occur as independent predicates, but in these they each have one subject, which must, as in all other sentences, appear after the first word.

5. Categories of “auxiliaries.” There is a limited class of lexical items that act as first elements in what we are assuming to be complex predicate constructions. These are presumably what the Thompsons were referring to as “auxiliaries.” The major feature—other than syntactic position—that these auxiliaries have in common is their lack of morphology.12 While generally in Klallam there seem to be few limits on what morphology can appear on which words in a sentence, the auxiliaries are almost always bare roots.13 They are always underived intransitives. While each is formed of a root that may appear transitivized in other constructions (for example, hiyáʔ ‘go’ becomes hiyátxw ‘take’), they are neither transitivized nor detransitivized when appearing as auxiliaries. While plural or diminutive morphology may appear on the main predicate or on any other full word in a sentence, neither may occur on the auxiliary. The same is true of aspect morphology, including the very common ‘actual’ imperfective aspect.

Although the auxiliaries have morphological and syntactic similarities, I show here that these items can be divided into at least four distinct categories based on their semantics and the morphological and syntactic details of the constructions in which they appear. The four categories are described in order: zero-class (5.1), ?uʔ-class (5.2), ?iʔ-class (5.3), and c-class (5.4). There is one apparent auxiliary (discussed in 5.5) that does not fall into any of these categories.

5.1 Zero-class auxiliaries and verbs. The zero-class auxiliaries are those that are immediately followed by the second predicate. Examples (7) and (14c) represent this class. In each of these, the predicate following the initial auxiliary–enclitic bundle has no proclitic; there is a zero connection

---

12 This lack of morphology was also correctly noted by Poggi (1981).
13 There are two apparent exceptions to the bare-root nature of the auxiliaries. The auxiliary sáʔan ‘constantly’ appears to be composed of a root sá and the -ʔan ‘middle’ suffix. This root has, however, never been recorded without the ending, so sáʔan may be a unit morpheme. The other exception is clearly a derived form. The auxiliary ?stáʔl ‘definitely’ has a root tšw ‘straight’ with the common morpheme combination ?s- ‘stative’ prefix, -l ‘durative’ suffix, and -a- ‘resultative’ infix. When not used as an auxiliary, this word has the meaning ‘be straight’ and the root appears in such words as tšwát ‘steer’ and tšwást ‘give a talking to, lit. straight-face someone’.
between the two predicates. Four lexical items have been identified as clearly belonging to this class: hiyā? ‘go’, ?ənʔá ‘come’, ḳ’áy ‘again’, and huy ‘finish’.¹⁴

5.1.1. hiyā? and ?ənʔá: a test for the category Verb. The two straightforward cases of zero-class auxiliaries are hiyā? ‘go’ and ?ənʔá ‘come’. These are common and occur with a wide variety of predicates, as shown in (16) and (17).

(16a) hiyā? caʔn ḳ’ácu.
go_1SUBJFUT fishing
‘I’ll go fishing’.

(16b) hiyā? cn ?uxʷ aʔ_cə _súl.
go_1SUBJ go there OBL_DET_door
‘I went over to the door’.

(16c) hiyā?_yaʔ _cn ñył aʔ_cə _snáxʷl.
go_PAST_1SUBJ go aboard OBL_DET_canoe
‘I went aboard the canoe’.

(16d) hiyā?_u_cxʷ ?ln?
go_QUEST_2SUBJ eat
‘Are you going to eat?’

(16e) hiyā?_cn ñitt.
go_1SUBJ sleep
‘I’ll go to sleep’.

(16f) hiyā?_u_cxʷ štənʔ?
go_QUEST_2SUBJ walking
‘Are you going walking?’

(17a) ?ənʔá_yaʔ _cn kʷ́ənənəŋ.
come_PAST_1SUBJ be seen
‘Someone came to see me’.

(17b) ?ənʔá _cn ?uxʷ aʔ_cə ’xʷ⁵⁴⁴cn.
come_1SUBJ go there OBL_Port Angeles
‘I came over to Port Angeles’.

(17c) ?ənʔá_yaʔ _cn haʔwí-st-áŋ
come_PAST_1SUBJ go forward-CAUS-PASSV
‘They brought me up front’.

¹⁴ Three other lexical items also seem to belong to this class: ?iyaʔ ‘be there’, ?dtaʔ ‘be here’, ?istá ‘let’s’.
AUXILIARIES IN STRAITS SALISHAN

(17d) ?ənʔá.cn t’ákwí.
          come_1SUBJ  cross
       ‘I came across’.

(17e) ?ənʔá.u-caʔ.cxw ?áʔn?
          come_QUEST_FUT_2SUBJ  eat
       ‘Will you come eat?’

(17f) ?ənʔá.st  k’qíct.
          come_1PLSUBJ  come up out of water
       ‘We came up out of the water’.

For the examples in (16), the hiyáʔ could be removed, the enclitic bundle put after the next word, and the translation would not be much different. What the auxiliary adds is a focus on the motion and its direction with respect to the speech act.

Although the range of lexical items that may occur as second predicates in these zero-class constructions is large, it is not unlimited. In fact, words that may appear here also form a distinct class. Words that can function as stative predicates, i.e., qualities and nominals, may not occur as the second predicate. Sentences such as those in (18) are consistently rejected, though not beyond interpretation.15

(18a) *hiyáʔ.cn šáʔsáʔl.
          go_1SUBJ  happy
(18b) *hiyáʔ.cn ʔáʔy.
          go_1SUBJ  good
(18c) *hiyáʔ.cn  nəʔáʔínə.
          go_1SUBJ  my house

This gives us a straightforward syntactic test for membership in a lexical category Verb in Klallam: any lexical item that may appear as the second predicate in a zero-class complex predicate construction is a verb.

5.1.2. K’áy and húy: a further test for the category Verb. It might be argued that, since they are motion predicates, hiyáʔ and ?ənʔá require only lexical items subject to motion as second predicates, and so the class is not entirely syntactically defined. Even if such nonmotion second predicates as ?itít ‘sleep’ (16e) and k’áʔxinnə ‘be seen’ (17a) are put aside, the other two zero-class auxiliaries show that this is not the case.

While hiyáʔ and ?ənʔá function in two ways—either as independent predicates or as zero-class auxiliaries—k’áy and húy each have three possible

15 Native speakers interpret these items in (18) as two sentences each. For example, ‘I went. He’s happy’. For meanings such as ‘I went happy’, ‘I went well’, or ‘I went to my house’, entirely different constructions are used.
functions: independent predicates, zero-class auxiliaries, and ?uʔ-class auxiliaries. Their meaning and function as ?uʔ-class auxiliaries are described in 5.2. As independent predicate or zero-class auxiliary, ḫ'áy means ‘again’ and húy means ‘finish’.

(19a) ḫ'áy.cn.
    again_1SUBJ
    ‘I did/will again’.
(19b) ḫ'áy.cn t'iym.
    again_1SUBJ sing
    ‘I’ll sing again’.
(19c) ḫ'áy_u cxw čáʔi?
    again_QUEST_2SUBJ working
    ‘Are you working again?’
(19d) ḫ'áy.cn ?tılan.
    again_1SUBJ eat
    ‘I ate again’.
(20a) húy.cn
    finish_1SUBJ
    ‘I finished’.
(20b) húy.cn t'iym.
    finish_1SUBJ sing
    ‘I finished singing’.
(20c) húy.caʔst čáʔi.
    finish_FUT_1PLSUBJ working
    ‘We’ll finish working’.

(19a) and (20a) show ḫ'áy and húy as independent predicates. Neither ḫ'áy nor húy are motion predicates, but the class of lexical items that can appear as second predicates with them is the same as the class that can appear as second predicates with auxiliaries hiyáʔ and ?ənʔáʔ. The second predicate may not be adjectival or nominal:

(21a) *拊'áy.cn šaʔsáʔl.
    again_1SUBJ happy
(21b) *拊'áy.cn ŋáʔ.
    again_1SUBJ good
(21c) *húy.cn nʔáʔiŋ.
    finish_1SUBJ my house
In order to convey ideas like ‘I’m happy again’ or ‘I’m good again’, the adjectival must be made a verb with derivational morphology, such as the verbal $tx^w a^?$. ‘mutative’ prefix, which is frequently translated ‘become’ or ‘get’.\(^{16}\) Compare (22) with (21a).

\[(22)\] \(k’ay\_cn \quad tx^w a^?\_s\_s\_t\).

\[\text{again\_1SUBJ \ MUT-happy}\]

‘I got happy again’.

There are at least two ways of fixing (21c) so that it makes grammatical sense. These fixes involve putting a determiner in front of the second lexical item so that we have an entirely nonauxiliary construction. (23a) is a simple transitive and (23b) is a simple intransitive.

\[(23a)\] \(huy\_tx^w\_cn \quad c\_n\_d\_i\).

\[\text{finish\_CAUSE\_1SUBJ \ DET\_my house}\]

‘I finished my house’.

\[(23b)\] \(huy \quad c\_n\_d\_i\).

\[\text{finish \ DET\_my house}\]

‘My house is finished’.

5.2. $u$ $u$-class auxiliaries: $u$ $u$ Adverbial Intensifiers. All of the auxiliaries listed by Thompson and Thompson (1971) and exemplified in (6) are in the $u$-class. The defining feature of this class is the required presence of the $u$ proclitic on the second element. With eleven lexical items identified as belonging to this group, it is the largest class of auxiliaries. Each is illustrated in (24).

\[(24a)\] \(k’u\_y\_cn \quad u\_s\_s\_u\_t\).

\[\text{also\_1SUBJ \ u\_happy}\]

‘I’m also happy’.

\[(24b)\] \(huy\_cn \quad u\_h\).

\[\text{only\_1SUBJ \ u\_go}\]

‘I’m only going’.

\(^{16}\) Gerdt and Hukari (2002) identify a class of “denominal” prefixes in Halkomelem. Cognate verbal prefixes exist in the Straits languages. These include $tx^w$- ‘buy’ (which occurs in Northern Straits but not in Klallam), $ksa^2$- ‘come from’, $k’$- ‘partake’, $k’a^2$- ‘go to’, $c$- ‘have’, and $c’$- ‘be affected by’. The stem that these prefixes attach to is interpreted as the object of the verbal sense of the prefix. None of these is productive; the range of stems to which each may attach is small, idiosyncratic, and partly semantically determined. The $t$-, for example, occurs only on a few stems that refer to things that can be eaten, drunk, or smoked; it cannot even occur on all foods, and certainly does not provide a test of what can be called a “noun.”
Note that in this construction the second element, the main predicate, is not restricted to verbs. Any word with appropriate meaning can be the second element here.

With one exception, all of the lexical items in this group may function as independent predicates. The exception is *mán* 'very' (illustrated in 6a and 24k), which requires a following *?u?-marked predicate. *mán* cannot stand
as an independent predicate itself, and it cannot occur with any of the morphology associated with predicative words. These facts indicate that *mán’* is, indeed, not a predicate but a member of a separate lexical category. If *mán’* is not a predicate, then this *?$u?$* construction is not a complex predicate construction. The most appropriate name for the lexical category that *mán’* represents is Adverbial Intensifier. The *?$u?$* clitic can be seen as a formative of an adverbial construction.

Since each of the other possible first elements in this construction has a similar function, they can be seen as derived adverbs. They are not morphologically derived but are derived by their position in the construction. Three characteristics of these constructions support this analysis. First, the semantics of each as represented in the translations in (24) are clearly adverbial. Each modifies the verbal or adjectival second element. Second, where possible, scope ambiguities arise just as one would expect from adverbs. For example, (24b) could also be translated ‘only I am going’, given the right context. Similarly, (24g) also means ‘I’m even talking’. The third characteristic is the most striking: there is an unpredictable but consistent semantic shift, typical of derivation, between the adverbial and predicative functions of most of the words appearing as first elements in (24). This semantic shift can be seen by comparing (24a) and (24b) with the forms in (19) and (20). As an adverbial *k’áy* means ‘also’, while in other constructions it means ‘again’. The adverbial *húy* means ‘only’, while in other constructions it means ‘finish’. Minimal pairs are shown in (25) and (26).

\[(25a) \ k’áy\_cn \ t’íym.\]
\[
\text{again}\_1\text{SUBJ sing}
\]
\`
I’ll sing again’.  

\[(25b) \ k’áy\_cn \ ?u\_t’íym.\]
\[
\text{also}\_1\text{SUBJ } ?u\_\text{sing}
\]
\`
I’ll sing, too’.  

17 Like the other auxiliaries, the root *mán’* may be transitivized with the causative suffix -txʷ. The resulting form *mán’txʷ* means something like ‘intensify’ and is not an auxiliary. This is the only morphology recorded occurring with this very common root.

18 Arregui and Matthewson (2001) demonstrate for Lillooet that there is no open class of Adverb. The situation is the same in the Straits languages. In order to say something like ‘he walked slowly’, constructions corresponding to ‘he was slow when he walked’ or ‘his walking was slow’ must be used.

19 The Saanich cognate *k’eʔ* patterns the same way: when followed by *?aw’* it means only ‘also’; in other constructions it means only ‘again’. Just as in Klallam there are no exceptions to this in the corpus, and native speakers are consistent in elicitation. Perhaps Lummi or Samish is different in this respect. Jelinek (1990:182) shows the Lummi/Samish cognate in a sentence with *?aw’* and glosses it as ambiguous between ‘again’ and ‘also’.
(26a) hûy.cn  t'iym.
    finish.1SUBJ  sing
    'I finished singing'.

(26b) hûy.cn  ?u?.t'iym.
    only.1SUBJ  ?u?.sing
    'Only I sang'.

A summary of the semantic shifts is given in (27).

<table>
<thead>
<tr>
<th></th>
<th>IN ?u?. CONSTRUCTION</th>
<th>IN OTHER CONSTRUCTIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>k'ây</td>
<td>'also'</td>
<td>'again'</td>

<tr>
<td>tù?x'w</td>
<td>'exactly'</td>
<td>'be in the middle'</td>
</tr>
</tbody>
</table>

These meaning differences are consistent among different speakers and are essentially the same in Northern Straits and Klallam. For some of the items, the semantic connection is obvious (cè?at, for example), while for others it is vague (tù?x'w) but recoverable. For tûx, the connection is obscure. The adverbial meaning of tûx is difficult to translate with a simple gloss. The examples in (28a)–(28g) show its range as an adverbial; (28h) shows its use as a predicate.

For čw'ín', the difference is surprising. Unlike the other meaning differences, where the meaning in the first column occurs only in the ?u? construction while the meaning in the second column occurs in all other constructions, the 'not even' reading of čw'ín' occurs only when it has a third-person subject and is followed by a determiner phrase marked for possession. It is not clear how this construction contributes to the meaning 'not even' since there is no negative element, and when čw'ín' occurs alone it means 'even'. Examples of čw'ín' are shown in (29).

The list in (27) has only eight of the eleven. As mentioned above, mán' occurs only in the adverbial construction, so is not listed. Of the other two, xăn' 'all' is very common and, though it usually does appear with the following ?u?, it can appear without it and without a change in meaning.
Unlike all of the other $u?$-class adverbs, it seems that $x\tilde{\mathrm{n}}?$ can occur as an
adverbial, a predicate, or as an adjective.

The final adverbial, $u?\tilde{\mathrm{u}}?$ (exemplified in 24j), is rare in the corpus. There
are not enough data to determine if it has some other function. It, appar-
ently, has no cognate in Northern Straits.

Note that when the stem shifts semantics in the adverbial construction it
usually becomes an intensifier. It seems likely that the one purely lexical
adverbial, $m\tilde{\mathrm{an}}?$, is the syntactic and semantic prototype for these derived
adverbs.

Perhaps these are not adverbs derived from predicates but separate lexical
items distinct from the homophonous predicates. If so, these lexical items
never appear in any other syntactic context and are thus of the distinct cat-
egory Adverbial Intensifier.

5.3. $u?$-class auxiliaries: $u?$ Adverbs. A group of lexical items simi-
lar to the $u?$ adverbs have the clitic $u?$ rather than $u?$ preceding the main
predicate. This is a much smaller set having only three basic members:
$\check{c}\tilde{\mathrm{ay}\ddot{\mathrm{d}}}$ ‘almost’, $h\check{\mathrm{ic}}$ ‘long since’, and $x\check{\nu}\check{\mathrm{\tilde{\beta}}}$ ‘possibly’. A fourth member is
derived from the first just mentioned, $k\tilde{\mathrm{\wr}}\tilde{\check{\mathrm{c}}}{\tilde{\mathrm{a}}}\ddot{\mathrm{y}\ddot{\mathrm{d}}}$ ‘soon’, with the ‘realized’
prefix $k\tilde{\mathrm{\wr}}\tilde{\cdot}$. These are illustrated in (30).

(30a) $\check{c}\tilde{\mathrm{ay}\ddot{\mathrm{d}}}_{-}cn\ u?_{-}t\tilde{\mathrm{\ddot{\nu}}}{\check{\mathrm{\eta}}}_{\check{\eta}}_{\check{\eta}}_{\check{\eta}}$.
almost$_{-}1$SUBJ $u?$_miss

‘I almost missed (the target)’.

(30b) $h\check{\mathrm{ic}}_{-}cn\ u?_{-}\tilde{\mathrm{\ddot{\nu}}}_{\check{\eta}}$.
long since$_{-}1$SUBJ $u?$_eat

‘It’s a long time since I ate’.

(30c) $x\check{\nu}\check{\mathrm{\tilde{\beta}}}_{-}cn\ u?_{-}\tilde{\mathrm{\ddot{\nu}}}_{\check{\mathrm{\ddot{\nu}}}}$.
possibly$_{-}1$SUBJ $u?$_go

‘I might go/I can go/It’s possible for me to go’.

(30d) $k\tilde{\mathrm{\wr}}\tilde{\check{\mathrm{c}}}{\tilde{\mathrm{a}}}\ddot{\mathrm{y}\ddot{\mathrm{d}}}_{-}cn\ u?_{-}\tilde{\mathrm{\ddot{\nu}}}_{\check{\mathrm{\ddot{\nu}}}}$.
soon$_{-}1$SUBJ $u?$_go

‘I go soon’.

Just as with most of the $u?$ adverbs, all four of these may be independent
predicates and, just as with most of the $u?$ adverbs, each of the three basic
forms has an unpredictable semantic shift. (31) shows the semantic shifts.20

20 Jelinek (1990:181) incidentally mentions $x\check{\nu}\check{\mathrm{\tilde{\beta}}}$ as a “modal predicate.” This is better ana-
lyzed as an adverbial since (1) there is otherwise no identifiable class of modal predicates in
Klallam or Saanich (and presumably in Lummi), (2) when used as a predicate it is not modal
at all, and (3) it has all the same syntactic and morphological characteristics as the other ad-
verbs. Jelinek (1990:182) also mentions $\check{c}\tilde{\mathrm{a}}\check{\mathrm{e}}\ddot{\mathrm{l}}\ddot{\mathrm{l}}$, the Northern Straits cognate for $\check{c}\tilde{\mathrm{a}}\ddot{\mathrm{y}\ddot{\mathrm{d}}}$, and lists
(31) | IN $i^?$ CONSTRUCTION | IN OTHER CONSTRUCTIONS |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>$\ddot{c}ay\dot{d}y$</td>
<td>‘almost’</td>
</tr>
<tr>
<td>híc</td>
<td>‘long since’</td>
</tr>
<tr>
<td>$x^\prime\eta$</td>
<td>‘possibly, might, can’</td>
</tr>
</tbody>
</table>

Examples of each of these in other constructions are shown in (32).

(32a) $\ddot{c}ay\dot{d}y$ ca $nsu?$ $\ddot{\alpha}n\eta$.  
barely DET_my missing  
‘I barely missed (the target)’.

(32b) híc $k^\prime i_nas?$ $\ddot{\eta}n$.  
long duration DET_my eating  
‘I ate a long time’.

(32c) $x^\prime\eta$ $\ddot{c}ay\dot{d}y$ $\ddot{\alpha}$ $hiy\ddot{d}$-n.  
quick lSUBJ WHILE_gO-lSS  
‘I’m quick when I go’.

The relationship between the two functions of $\ddot{c}ay\dot{d}y$ is very similar to the relationship between the two functions of the $u^?$ adverbial $\ddot{c}w$‘$\ddot{\acute{\i}}n$’ ‘even; not even’ illustrated in (29). In each, the meaning in its nonadverbial function is negative with respect to its meaning as an adverbial. The sentence in (30a) implies that the target was hit by a narrow margin, while (32a) implies that the target was not hit by a narrow margin. Also, the morphological and syntactic requirements are the same: the nonadverbial use for each requires a third-person subject and a determiner phrase marked for possession.

What these $i^?$ adverbs have in common in contrast to the $u^?$ adverbs is reference to time. Though $\ddot{c}ay\dot{d}y$ can be used for both time and space, when it has the ‘realized’ prefix in $k^\prime l\ddot{c}ay\dot{d}y$ it refers only to time. This may be historically related to the semantics of the $i^?$ proclitic.

5.4. **On the distinction between $i^?$ and $u^?$ and their functions with different categories.** There are at least two separate morphemes, proclitic or prefix, with the form $i^?$. One is an aspectual prefix that indicates continuing motion. The other is the comitative conjunction mentioned in 3 above. Both are illustrated in one compound sentence in (33), showing that they are two different morphemes.

(33) $\ddot{x} \ddot{d}l$ $\ddot{c}ay\dot{d}y$ $\ddot{\alpha}$ $\ddot{\acute{\i}}n\eta$ $\ddot{\alpha}n\eta$.  
sick lSUBJ COM_CONTIN-walking-lSUBJ  
‘I’m sick and I’m walking’.

It as one of the $u^?$ adverbs ("second order predicate") but gives no examples. This is a fairly frequently occurring word in both Klallam and Saanich and it has never been recorded with a following $u^?$.
(33) has an equivalent sentence with conjunction reduction, shown in (34).

(34)  
\[
\begin{array}{c}
sick_{\text{SUBJ}} \text{COM}_{\text{CONTIN}} \text{-walking}
\end{array}
\]

'I'm sick and I'm walking'.

Note that the form of (34) is superficially the same as the ?i? adverbial constructions in (30). They are not the same constructions, however, since, when a main clause subject for the second predicate is added, the meaning is changed, becoming two separate clauses as in (35), which native speakers find of marginal acceptability. Compare (35) with (30a).

(35)  
\[
\begin{array}{c}
barely_{\text{SUBJ}} \text{COM}_{\text{miss}}_{\text{SUBJ}}
\end{array}
\]

'I barely did it and I missed'.

The conjunction ?i? has inherent temporal semantics; it conjoins only simultaneous events. It differs both from a logician's 'and' that conjoins predicates regardless of temporal relationship and from a sequential 'and' that implies the event of the first conjunct precedes the second in time. This was recognized by Thompson and Thompson (1971) with their "accompanying" label, by Efrat's (1969) gloss "simultaneity" for the Sooke cognate, and by Raffo's 1972 gloss "simultaneous" for Songish. The fact that the ?i? adverbs each have time-related semantics, while none of the ?u? adverbs do, indicates that the ?i? of the adverbial construction must be historically related to the conjunction ?i?.

Thompson and Thompson (1971) and Montler (1986) call the ?u? "contemporaneous," Poggi (1981) labels it "aspect," and Jelinek (1990) labels it "link." While only Jelinek identifies it as crucial to the adverbial construction, all identify this ?u? with an ?u? proclitic that appears in clause-initial position and indicates discourse or extralinguistic contrast. Though they are perhaps historically related, these are synchronically distinct. The contrast marker appears in sentences such as ?u?_\text{-sātāŋ} \_cn 'I'm walking'. The sentence without the ?u? is also translated 'I'm walking', but native speakers consistently use contrastive intonation in the English translation of the form with the ?u?. Generally, this initial ?u? means something like 'contrary to what one might think' or 'in contrast to the previous context'. Out of context this ?u? is optional. The ?u? in the "auxiliary" construction is NOT optional and never carries semantic or pragmatic function. It is strictly a construction formative.

When the ?i? conjunction and ?u? contrast marker both appear before a second predicate, the translation usually includes 'but', as in (36).

\footnote{When ?i? and ?u? appear together, the phonetic result is usually yu?.}
AUXILIARIES IN STRAITS SALISHAN

(36) xá̱l.cn ?i?_?u?_?i?-šståŋ.
sick._SUBJ COM_CONTRAST_CONTIN-walking

‘I’m sick but I’m walking’.

5.5. c-class auxiliaries: Negative Adverbs. The c-class auxiliaries are a class of only two lexical items: ?áwə ‘not’ and ?áʔə? ‘not yet’. These both require that the following main predicate be preceded by the c proclitic or prefix. This c is probably cognate with the Thompson ka ‘unrealized’ particle (Thompson and Thompson 1992:150) and the Moses-Columbia ‘unrealized’ prefix kas- described by Mattina (1997:331). The Thompson and Moses-Columbia negative constructions look very similar to the Klallam pattern. Unlike the cognates, however, the distribution of the Klallam c is extremely limited—it occurs only before predicates following ?áwə and ?áʔə?.22 Examples of ?áwə, a very common word, are shown in (37) and of ?áʔə?, much less common in the corpus, in (38).

(37a) ?áwə c_həwíyyŋ.
not c_return

‘She didn’t return’.

(37b) ?áwə.cn c_xʷənítəm.
not._SUBJ c_white person

‘I’m not a white man’.

(37c) ?áwə.cxʷ c_čáʔsə.
not._2SUBJ c_two people

‘There aren’t two of you’.

(37d) ?áwə c_náʔkʷ.
not c_you

‘It’s not you’.

(37e) ?áwə.cn c_kʷánn-əŋ.
not._SUBJ c_see-PASSIV

‘I wasn’t seen’.

(37f) ?áwə.cn c_ʔá’y’. 
not._SUBJ c_good

‘I’m not well’.

22 The situation in Klallam is clearer than in Northern Straits. The Northern Straits cognate is s (Montler 1986:191), merging phonologically with other s prefixes. Once all the s’s are properly sorted out, the pattern in Northern Straits seems to be the same as Klallam.
(37g) ?dwa ya? st c-skʷúkʷl.
not_past_1_plsubj c-go to school
‘We didn’t go to school’.

(38a) ?u?a?_cn c_ʔln.
not yet_1_subj c_eat
‘I didn’t eat yet’.

(38b) ?u?a? c_ʔx’ám’.
not yet c_enough
‘It’s not yet enough’.

(38c) ?u?a? c-táči.
not yet c_arrive here
‘He didn’t get here yet’.

(38d) ?u?a?_cn c_hiyá?.
not yet_1_subj c_go
‘I’m not going yet’.

?dwa can stand alone as a negative answer to a yes/no question. Aside from that and from the adverbial function shown in (37) and (38), both of these negative words can be predicative. Either word may occur with a subject and no following predicate, as illustrated in (39).

(39a) ?dwa cn.
not_1_subj
‘I’m not/I didn’t/I won’t’.

(39b) ?dwa cə_kʷátʔen.
not det_rat
‘Rat won’t’.

(39c) ?u?a?_cn.
not yet_1_subj
‘I didn’t yet’.

5.6. huʔ conjoined conditional. huʔ may fit the definition of “auxiliary” or “adverbial,” but it has a unique distribution that distinguishes it from the other “auxiliaries” and, indeed, from all other roots. This root never takes any morphology and occurs in only one construction. It is used in a construction that is the most common way of expressing a conditional statement. A conjoined conditional construction uses a sentence-initial root huʔ, as illustrated in (40).

(40) huʔ caʔ cxʷ hiyáʔ ?iʔ_hiyáʔ caʔ n.
if/when_fut_2_subj go com_go_if_fut_subj
‘I’ll go if/when you go’.
The *hu?* root in (40) seems to pattern with the zero-class auxiliaries discussed in 5.1—*hu?* and its enclitics are immediately followed by a main predicate. It differs from them in two respects, however. First, *hu?* is never predicative itself; it must always be followed by a predicate. So forms like *hu?_ca?_cxw* are unacceptable alone. The second difference is that it must be the first word of the first of a pair of conjuncts; it never occurs in a simple, noncompound sentence. So forms like *hu?_ca?_cxw hiyâ?* are unacceptable alone. The two conjuncts must appear with the *hu?* clause first, so *hiyd?_ca?n ?i? hu?_ca?_cxw* is unacceptable. This is unique in that, with its main-clause subject, it has the form of an independent clause but cannot occur independently.

6. Transitive main verbs with auxiliaries and adverbs. Another interesting difference between the true auxiliaries (zero-class) and the adverbs is in the interpretation of an immediately following determiner phrase. As established in 5.1, the identifying feature of the true auxiliaries is the immediately following verb. In all of the examples in that section the main verb is intransitive. While intransitive verbs usually occur with the auxiliaries, a transitive verb is also possible. Examples are shown in (41). Compare especially (17a) with (41a).

(41a) ?en?á_ya?_cn  k"wônnexw.23
    come_PAST_1SUBJ  see:3OBJ
    'I came to see him'.

(41b) ?en?á_ya?_cn  k"wenn-úñu
    come_PAST_1SUBJ  see-2OBJ
    'I came to see you'.

(41c) ?en?á_ya?  k"wônt-s.
    come_PAST  look:3OBJ-3SUbj
    'He came to look at him'.

The third-person transitive subject is not an enclitic, as are the first and second persons, but a suffix that remains on the main verb and does not move to second position. An explicit third-person object determiner phrase must follow the main verb, as illustrated in (42).24

(42) ?en?á_ya?  k"wônt-s  ca_snáxw.1f.
    come_PAST  look_at:3OBJ-3SUbj  DET_canoe
    'He came to look at the canoe'.

23 The third-person object is zero. This word has the -naxw 'noncontrol' transitivizer.
24 It is not actually possible to distinguish structurally between the interpretation given in (42) and an interpretation where (42) is two sentences: 'He came. He looked at the canoe'. The same is true of (43), which could be 'He came. The canoe was looked at by the man'.
An important feature of auxiliaries is that mention of an explicit agent in a
determiner phrase requires the use of the passive, as in (43).

come_PAST look at-PASSIV DET_canoe OBL_DET_man

'The man came to look at the canoe'.

Up to a point, the adverbs pattern similarly. Compare the examples in
(44) with those in (41), (42), and (43).

(44a) čw'ín'_cn ?uʔ_c'sáť.
even_1SUBJ ?uʔ_hit:3OBJ

'I even hit him'.

(44b) čw'ín'_cn ?uʔ_c'sáč.
even_1SUBJ ?uʔ_see:2OBJ

'I even hit you'.

(44c) čw'ín' ?uʔ_c'sáť-s.
even ?uʔ_hit:3OBJ-3SUBJ

'He even hit him'.

(44d) čw'ín' ?uʔ_c'sáť-s ca(nc)áť.
even ?uʔ_hit:3OBJ-3SUBJ DET_my father

'He even hit my father'.

(44e) čw'ín' ?uʔ_c'sáť-әә ca(nc)áť ?aʔ_ca_swáý'qa?.
even ?uʔ_hit-PASSIV DET_my father OBL_DET_man

'The man even hit my father’ or ‘My father was even hit by the
man'.

As described in 5.2, the adverbial differs from the auxiliary in that the con-
struction-defining characteristic is not an immediately following verb but a
following ?uʔ-marked predicate. The adverbial also differs from the auxil-
ary in that the passive is NOT required when a transitive agent is explicitly
mentioned in a determiner phrase. The subject determiner phrase comes be-
fore the ?uʔ-marked predicate. Compare (44d) with (45).

(45) čw'ín' ca(nc)áť ?uʔ_c'sáť.
even DET_my father ?uʔ_hit:3OBJ

'My father even hit him'.

The adverbial construction allows the agent determiner phrase to be explicit-
ly mentioned without resorting to the passive. The agent precedes the main
verb, and the -s third-person transitive subject marker is missing from the
verb in this construction. Example (46) shows the auxiliary ?onʔad in a con-
struction parallel to that in (45).
(46) ?en?á có_swóy'qa? k"ónnax".
come DET_man see:3OBJ

'The man that saw him came'.

The determiner phrase here cannot be interpreted as the subject of the second verb, and this sentence cannot be interpreted as an auxiliary/complex predicate construction. The only possible interpretation is as a simple predicate with a relative clause construction as subject. Relative clauses in Klallam are essentially the same as in Saanich (Montler 1993). In (46), swóy'qa? is the head and k"ónnax" is the restricting clause, while ?en?á is the main verb.

7. Adjectives and Nouns. Though no one has referred to any of the components of constructions like the one in (47) as "auxiliaries," this construction has been called a complex predicate.

(47) čóq_cxw swóy'qa?.
big_2SUBJ man

'You are a big man'.

Jelinek (1990:188) identifies constructions such as (47) with what we have been calling the zero-class or true auxiliaries, discussed in 5.1. They do indeed look similar to those complex predicates. As shown in (48), both of the words in (47) can be predicative and there is nothing else between them.

(48a) čóq_cxw.
big_2SUBJ

'You are big'.

(48b) swóy'qa?_cxw.
man_2SUBJ

'You are a man'.

The construction in (47) does differ, however, from the auxiliary constructions both semantically and distributionally. Semantically, in this construction the first word is always a quality and the second is always nominal, never verbal. In contrast, the four auxiliaries of 5.1 are always followed by a verb, never by an adjectival or nominal word. This alone suggests that we have at least a separate category of auxiliary whose defining characteristic is that it must be followed by a nominal predicate. As a corollary to that, we must have a category of nominal predicates that may follow these adjectival auxiliaries.

A more definitive difference between these adjectivals and the auxiliaries is that these can take regular morphology. As noted in 5 above, one of the defining characteristics of the auxiliaries (and the adverbs) is that they
participate in no regular morphological processes—they are typically bare stems. The adjectivals, in contrast, may be, and in some cases must be, marked with the collective plural morphology.

It is necessary, first of all, to point out that plural marking is not obligatory in Klallam. Both examples in (49) are acceptable and are synonymous. (49a) shows the singular form for ‘man’ and (49b) shows the reduplicated plural.

(49a) čáʔsaʔ swóy’qaʔ
two man ‘two men’

(49b) čáʔsaʔ sw’wóy’qaʔ
two men ‘two men’

The adjectival in (47) may be pluralized with a singular nominal following, as in (50).

(50) čáʔq cxʷ hay swóy’qaʔ.
bigPL_2SUBJ_2PL man ‘You are big men’.

And, just as in (49b), the nominal may also be plural, as in (51).

(51) čáʔq cxʷ hay sw’wóy’qaʔ.
bigPL_2SUBJ_2PL men ‘You are big men’.

But when the nominal is plural, the adjectival is also required to be plural. So (52) is unacceptable.

(52) *čáʔq cxʷ hay sw’wóy’qaʔ.
big_2SUBJ_2PL men

This agreement is required not only in predicates but also in determiner phrases. (53) shows the same pattern as (47) and (50)–(52).

(53a) kʷánnaxʷ cn čáʔq swóy’qaʔ.
see:OBJ_1SUBJ DET_big man ‘I see the big man’.

(53b) kʷánnaxʷ cn čáʔq ċáʔq swóy’qaʔ.
see:OBJ_1SUBJ DET_bigPL man ‘I see the big men’.

(53c) kʷánnaxʷ cn čáʔq sw’wóy’qaʔ.
see:OBJ_1SUBJ DET_bigPL men ‘I see the big men’.
There is one further restriction on these forms: the order of the words in (47) cannot be reversed, as shown in (54).

(54) *sw'y'qa?_cxw cdq.  
The adjectival čq must be in a separate category from the nominal sw'y'qa?.

The special semantic, morphological, and syntactic restrictions on the categories of words such as those shown in (47) lead us to conclude that they are distinct categories from each other and that neither is in the same category as the auxiliaries. They are not adverbs nor do they pass the test for the category verb discussed in 5.1.1 and 5.1.2. The most appropriate category names for words like čq and sw'y'qa? are Adjective and Noun, respectively.

8. An unrelated piece of evidence. Examples (55) and (56) show typical simple transitive clauses.

(55) šč'ášt.cn.  
'I hit it'.

(56) hámont.cn.  
'I hammered it'.

When such roots of high semantic transitivity occur bare without the t-transitivizing suffix the normal interpretation of the subject is as patient, or undergoer, as in (57).25 These are unaccusatives or what Thompson (1979b) called the noncontrol roots.

(57) šág'.cn.  
'I got hit'.

But such an interpretation is not possible with the root /hámən/. The only possible interpretation for (58), which is parallel to (57), does NOT have the expected patient subject. The only possible interpretation is semantically anomalous.

(58) hámən.cn.  
'I am a hammer' (NOT 'I got hammered').

This small piece of evidence alone indicates that /hámən/ must belong to a separate category that looks very much like what we would call a noun.

25 Roots in Klallam and Northern Straits can be classified, independently of the categories noun and verb, based on their inherent semantic transitivity (Montler 1989). Two-participant roots of high effect (with meanings like 'hit', 'cut', etc.) may occur bare with a patient subject, while two-participant roots with low effect ('know', 'see', etc.) may not occur bare. There are at least five such classes of roots.
9. Conclusion. By considering their surface syntactic and morphological distribution, the “auxiliaries” of Thompson and Thompson (1971) are shown to be a different grammatical category from those of Thompson (1979a). There is a small class of complex predicate-forming lexical items in Klallam that can be called “auxiliaries.” Only four have been identified thus far. The auxiliaries are shown to be distinct from adverbs. Once the category “auxiliary” is established, we are able to find a simple, superficial distributional test for membership in a grammatical category “verb.”

We can identify three categories of “adverbial intensifier” depending on what proclitic the adverbial requires on the main predicate: ?u?-class, ?i?-class, or c-class. The distinct semantic shift of adverbs that function in other constructions as predicates shows that they form a category distinct from verbs and other predicative categories. The adverbs are also shown to be distinct from the auxiliaries in the syntax of determiner phrase agent placement when the main verb is third-person transitive.

Finally, the grammatical categories “adjective” and “noun” are established by their distribution in contrast to auxiliaries in complex predicates. While auxiliaries are never morphologically marked, an adjective must be marked for the collective plural if its accompanying noun is collective plural.

The grammatical patterns described here for Klallam are essentially the same in Northern Straits. These categories were arrived at by looking at the surface distribution of lexical items in constructions. No reference was made to particular morphology allowed on particular lexical items independent of the constructions in which they appear.

Klallam and other Salishan languages are unlike most languages—for example, a Muskogean language like Alabama—where, although there is no ‘be’ verb, a number of simple morphological tests for membership in the categories “noun” and “verb” can be found during the first few fieldwork sessions. Alabama nouns and verbs differ in diminutive, number, aspect, and negative morphology. In contrast, almost any lexical item in Klallam can be predicative, plural, diminutive, imperfective, transitivized, and so on, with uniform morphology. What is surprising is that in languages having as much morphology as Klallam, Northern Straits, and other Salishan languages, there seems to be a scarcity of general, simple, morphological tests for membership in syntactic categories. Although with the evidence continuing to accumulate from across the Salishan family it now seems certain that we can identify distinct grammatical categories, the languages are no less amazing.
